

Module 02 Lab Exercise - Individual Contribution Journal

ITAI 1371 - Introduction to Machine Learning

Keira Burdine

For this assignment, I independently completed all required sections of the Module 02 Lab Exercise. I worked through the notebook, executed and reviewed the required code, analyzed the Iris dataset, created the required visualization, and documented my findings from the data.

One of the main challenges I experienced was developing a better understanding of how to interpret the dataset and recognize what the different features and values represented. Working through the exercises helped me become more comfortable analyzing the information rather than simply running the code.

I also communicated with my group regarding the assignment requirements and completion process. After completing and checking my work, I created a GitHub repository for the lab and uploaded my completed notebook and PDF so that the assignment materials could be organized and available.

Overall, my contribution included completing and testing my version of the lab, documenting my analysis, communicating with the group, and helping establish a GitHub repository for the project.

John Grubbs

For this assignment, I independently completed the Module 02 Lab Exercise and wrote the reflective journal based on my experience working with the Iris dataset. I reviewed the dataset, examined the visualizations, and documented the patterns I observed between the Setosa, Versicolor, and Virginica classes.

I also reflected on the issues I had while working with the Google Colab environment, Jupyter Notebook cells in VS Code, and Python libraries for data analysis and visualization. My contribution included completing and reviewing my work, documenting what I learned, and compiling the team's work.

Luis Adrian

Analyzed how the DataFrame presented information on the three species and their numerical data. Compared the DataFrame's data with the bar chart and scatter plot to see if the information they displayed was consistent and to ensure that the visualizations did not contradict the DataFrame.
